

Count Sort Algorithm ~

Count Sort !

* Non comparison sorting algorithm .
* good for smaller numbers.

$O(N+M)$

	0	1	2	3	4	5	6	7
N =	3	4	1	3	2	5	2	8

① Select the largest number = 8

② create an array of largest + 1.
so size 9

0	1	2	3	4	5	6	7	8

③ Now create a frequency array
where index no is equal to element
number

	0	1	2	3	4	5	6	7	8
M =	0	1	$\frac{1+1}{=2}$	$\frac{1+1}{=2}$	1	1	0	0	1

Replace the original array.

0	1	2	3	4	5	6	7
1	2	2	3	3	4	5	8

Array Sorted

Time Complexity : $O(N+M)$
Space complexity : $O(N+M)$

We can also do ^{this} by HashMap :

3	-	2	<u>max = 8</u> i = 0 till 8 map.get(i)
4	-	1	
1	-	1	
2	-	2	
5	-	1	
8	-	1	

1	2	2	3	3	4	5	8
---	---	---	---	---	---	---	---

Time complexity : $O(N+M)$
Space complexity : $O(M)$

Code ~

```
public class countSort { // this is a stable sort
```

Algorithm

```
    public static void countSort(int[] arr) {  
        if (arr == null || arr.length <= 1) {  
            return;  
        }
```

```
    }
```

```
        int max = arr[0]; // find the max  
                           element in the array.
```

```
        for (int num : arr) {
```

```
            if (num > max) { // if the current  
                max = num;  element is greater  
            }               than max
```

```
        }
```

```
        int[] countArray = new int  
                           [max + 1];
```

```
        // create a count array of size max+1.
```

```
        for (int num : arr) {
```

```
            countArray[num] ++;
```

```
        // Count the frequency of each element  
        in the array  
    }
```

```

int index = 0;
for (int i = 0; i <= max; i++) {
    while (countArray[i] > 0) {
        array[index] = i; //

```

Replace the element in the array with the sorted element

```

        countArray[i]--;
    }
}

```

```

}

```

// we can also create count sort using Hash Map to store the frequency of each element in the array

```

public static void countSortHashMap(
    int[] arr) {

```

```

    if (arr == null || arr.length <= 1) {
        return;
    }

```

```

    int max = Arrays.stream(arr).
        max().getAsInt();

```

```

    int min = Arrays.stream(arr).
        min().getAsInt();

```

// now MapOut the frequency of each element in the array

```
Map < Integer, Integer > countMap = new  
HashMap();
```

```
for (int num : arr) {  
    countMap.put (num, countMap.  
        getOrDefault (num, 0) + 1); //
```

if the number is not present, then add default 0 or else increments the value by 1

```
int index = 0;
```

```
for (int i = min; i <= max; i++) {  
    int count = countMap.getOrDefault  
        (i, 0); // get the  
    frequency of the element.
```

```
    for (int j = 0; j < count; j++) { //
```

loop will run that many times the number appeared in the array if 2 appeared 2 times it will run the loop for 2, two times

```
arr [ index ] = i ; // Replace  
index ++;
```

```
}  
}  
}
```

```
public static void main (String[] args) {
```

```
int [] arr = { 4, 2, 2, 8, 3, 3, 1 };
```

```
// countSort ( array ),  
countSortHashMap ( array ),
```

```
System.out.println ( Arrays.toString (  
array ));
```

```
}  
}  
}
```
